WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Reports, Forms 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

In this report admission rates are shown for all causes (disease and injury) combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The number of patients remaining in hospital at the end of the week per thousand strength as given in this report furnishes an approximation to the current non-effective rate. The mean number of non-effectives per thousand strength is given in the summary table for the total United States and for each of the Service Commands.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having a strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of bed capacity (normal and total), beds occupied and beds "available vacant." The number of beds "available vacant" is defined as 80% of the total bed capacity less the corresponding beds occupied. The number of beds "available vacant" for each Service Command is the total of the beds "available vacant" for only those stations in which 80% of the total bed capacity exceeds the beds occupied. Beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in this report.

In the case of general hospitals there are shown, in addition, the number of Army patients admitted and disposed of during the week (by death, return to duty, transfer, or otherwise), the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, and corresponding data for battle casualties. Where the hospital has convalescent facilities, the letters (CF) appear after its name. The patients "otherwise" disposed of represent for the most part discharges on account of disability. In the case of Army battle casualties, all of which are currently admitted to general hospitals in this country as transfers, there is shown for each hospital the net number transferred during the week; i.e., admissions by transfer less dispositions by transfer. The total for the country as a whole represents the number of battle casualties evacuated to the United States from overseas theaters.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where part or all of the current week's data for a particular station has not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 25 FEBRUARY 1944

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

All Causes: Disease and Injury:

As indicated in the chart on page 3, the admission rates from all causes and from all diseases combined both decreased slightly, reflecting a commensurate decline in morbidity from colds, influenza, etc. For the week ending 25 February 1944, the admission rate from all causes was reported at 772 per year per thousand, while the admission rate from disease was reported at 704 per year per thousand. These rates were both 24 percent below the corresponding rates for the week ending 26 February 1943. The admission rate from injury also decreased slightly to 68 per thousand, continuing on the low level which has prevailed thus far in 1944.

Respiratory Causes

The admission rate from colds, influenza, etc. for the week ending 25 February 1944 was 269 per year per thousand (or about 3 percent lower than for the preceding week) which is 30 percent under that recorded for the corresponding week of February 1943. The admission rate from pneumonia increased slightly during the week, but remains about 20 percent below the rate for the last week of February 1943.

Common Communicable Diseases:

New cases of measles (which had shown a decline the preceding week) increased to about the same figure as had been reported for the week ending 11 February 1944. New cases of mumps and especially of scarlet fever also rose sharply to the highest figures reported in 1944 to date. The number of new cases of meningitis and of rheumatic fever remained substantially the same as for the preceding week.

VARIATION IN MORBIDITY BY SERVICE COMMANDS:

All causes: Disease and Injury:

The Fifth, Sixth, and Eighth Service Commands were the only ones to report higher morbidity from all causes and from disease for the week ending 25 February 1944. The Second and Third Service Commands and the Military District of Washington experienced markedly lower admission rates from all causes and from disease, while the other Service Commands reported relatively insignificant decreases in morbidity. The highest admission rate from all causes (of about 1030 per thousand) was reported from the Sixth Service Command. The Ninth Service Command continued to be the only one reporting morbidity from all causes below 700 per thousand.

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 25 FEBRUARY 1944

COMMENT ON CURRENT TRENDS (CONT'D)

Respiratory Causes:

The Fifth, Sixth and Seventh Service Commands reported slightly higher morbidity from colds, influenza, etc. while all the other commands reported lower admission rates. The decline in the morbidity from colds, influenza, etc. in the Military District of Washington accounted for all of the decline in the admission rate from disease in that Command, but the corresponding decreases in the morbidity from colds and influenza in the Second and Third Service Commands were responsible for only part of the marked decreases in the admission rate from disease experienced in those Commands. The Seventh Service Command continued to report the highest admission rate from colds, influenza, etc. (476 per thousand), while the lowest morbidity from these causes (204 per thousand) was again reported by the Eighth Service Command. A sharp decline in morbidity from pneumonia was registered in the Military District of Washington.

Common Communicable Diseases:

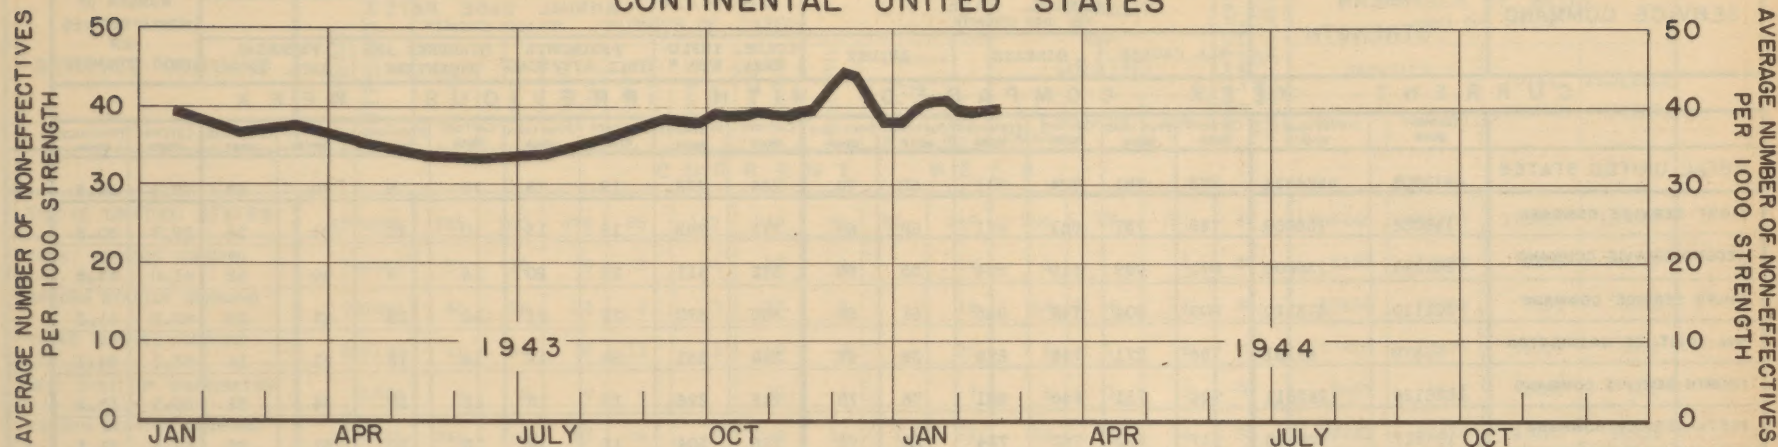

The Second and Sixth Service Commands which had experienced the highest morbidity from venereal disease (excluding EPTI cases) the preceding week reported a marked decline in admissions from these causes for the week ending 25 February 1944. The increased numbers of new cases of measles reported from the Second, Third, and Eighth Service Commands account for practically the entire increase in the total number of new measles cases in the country. The Fourth and Eighth Service Commands continued nevertheless to show, by far, the largest number of new cases of measles. The largest increase in the number of new cases of mumps occurred in the Fourth Service Command which continued to account for about 30 percent of the total number of cases of mumps. The new cases of scarlet fever were more uniformly spread.

CURRENT HOSPITAL CONDITIONS

The total bed capacity as of 25 February 1944 was reported at 382,000 or 4,000 more than at the end of the previous week; this was not an actual increase, but was the result of corrected reporting by the Fourth Service Command. The number of beds occupied as of 25 February was about 173,000 or 1,000 less than at end of previous week. The number of "available vacant" beds increased to 134,000 due in part to the aforementioned correction in the reporting of bed capacity. On 25 February there were 22 stations with bed capacity of about 11,000 having no "available vacant" beds; included were only two General Hospitals with bed capacity of 2350. On 25 February 1944 there were 2230 cases of malaria remaining under treatment, all but 21 of which had presumably been acquired outside United States. The number of neuropsychiatric cases remaining at end of week was reported at 16,887 while the number of tuberculosis cases remaining totaled 1127.

SUPPLEMENTARY HEALTH REPORT

FOR THE FOUR WEEK PERIOD ENDING 28 JANUARY 1944

COMMENT ON RECENT DEVELOPMENTS

NATURE OF THE DATA

The data of this supplementary report, like those of the Weekly Health Reports, have been taken from Forms 86ab rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. However unlike the Weekly Health Reports which are compiled on the basis of the figures as received, so as to place the information in circulation at the earliest possible time, the figures here presented for the four week period ending 28 January 1944 include the great majority of the corrected reports as well as reports received too late to be incorporated in the Weekly Health Report.

This supplementary report covers morbidity data for all individual stations with a strength of 1000 or over and gives details for admissions from venereal disease and for neuropsychiatric cases. However neuropsychiatric admissions are not shown classified as between locked ward cases and other cases, as had been done in previous months, because the use by many stations of the revised Form 86ab rendered such information unavailable for all stations.

Charts showing morbidity trends from all causes, from disease from injury and from colds, influenza, etc. are presented on page 33. Similar charts for specified diseases appear on pages 35, 37 and 39. A chart showing morbidity trends from all causes, from disease, and from injury is presented on page 41. A summary of the number of admissions and corresponding morbidity rates and of the number of deaths and corresponding mortality rates for the United States as a whole and for the Service Commands is given on page 42. The most pertinent morbidity data for individual stations are presented on pages 43 to 74. On pages 75 and 76 the six stations with the highest rates of admission during the four week period ending 28 January 1944 are shown for each of the morbidity categories considered.

In reading the detailed tables, it should be borne in mind that morbidity (or mortality) rates based on small numbers of cases are not reliable. For this reason the symbol "?" has been placed after rates computed on the basis of 5 or fewer cases.

MORBIDITY FROM ALL CAUSES: DISEASE AND INJURY

During the four week period ending 28 January 1944 morbidity from all causes was very much lower than in December 1943, because the outbreak of respiratory infections which reached its peak early in December 1943 had virtually subsided by the end of that month. The annual admission rate from all causes for the four week period ending 28 January 1944 was reported at 847 per 1000 strength, which was about 17 percent below that for December 1943. From recently revised admission rates for the early months of 1943, it appears that the morbidity from all causes experienced during the first four weeks of January 1944 was also 17 percent below that for January 1943 (revised basis).

The annual admission rate from diseases for the four week period ending 28 January 1944 was reported at 778 per 1000 which was 18 percent below the corresponding rate for either December 1943 or January 1943

COMMENTS ON RECENT DEVELOPMENTS (CONT'D)

(revised basis). The entire decrease in the admission rate for disease from December 1943 to the first four weeks of January 1944 is accounted for by lower morbidity from respiratory causes.

The admission rate from injury rose slightly from the record low registered in December 1943 to 69 per year per 1000, which is substantially the same as that reported in January 1943.

Every Service Command reported markedly lower morbidity during the first four weeks of January 1944 as compared with December 1943 and the largest decreases in admission rates from all causes and from disease occurred in the Commands which had experienced the highest morbidity from colds, influenza, etc. (Seventh and Second Service Commands and the Military District of Washington). The Seventh Service Command continued nevertheless to report the highest admission rates from all causes and from disease - about 25 percent higher than for the country as a whole. The lowest admission rates from all causes and from disease, about 15 percent below those for the United States as a whole, were registered in the First Service Command.

Higher morbidity from injury was reported from every Service Command except the Military District of Washington and the Fourth Service Command, but only the First and Third Service Commands recorded sharp increases in injury admission rates. During the first four weeks of January 1944 the annual admission rate from injury in the Military District of Washington fell to the exceptionally low figure of only 36 per 1000, while the Second, Fifth and Seventh Service Commands showed relatively low injury rates in the range from 57 to 60 per 1000. The First, Third, Fourth, Seventh, Eighth and Ninth Service Commands experienced relatively high injury rates in the range from 70 to 73, but these rates were nevertheless low compared to past experience.

RESPIRATORY DISEASES

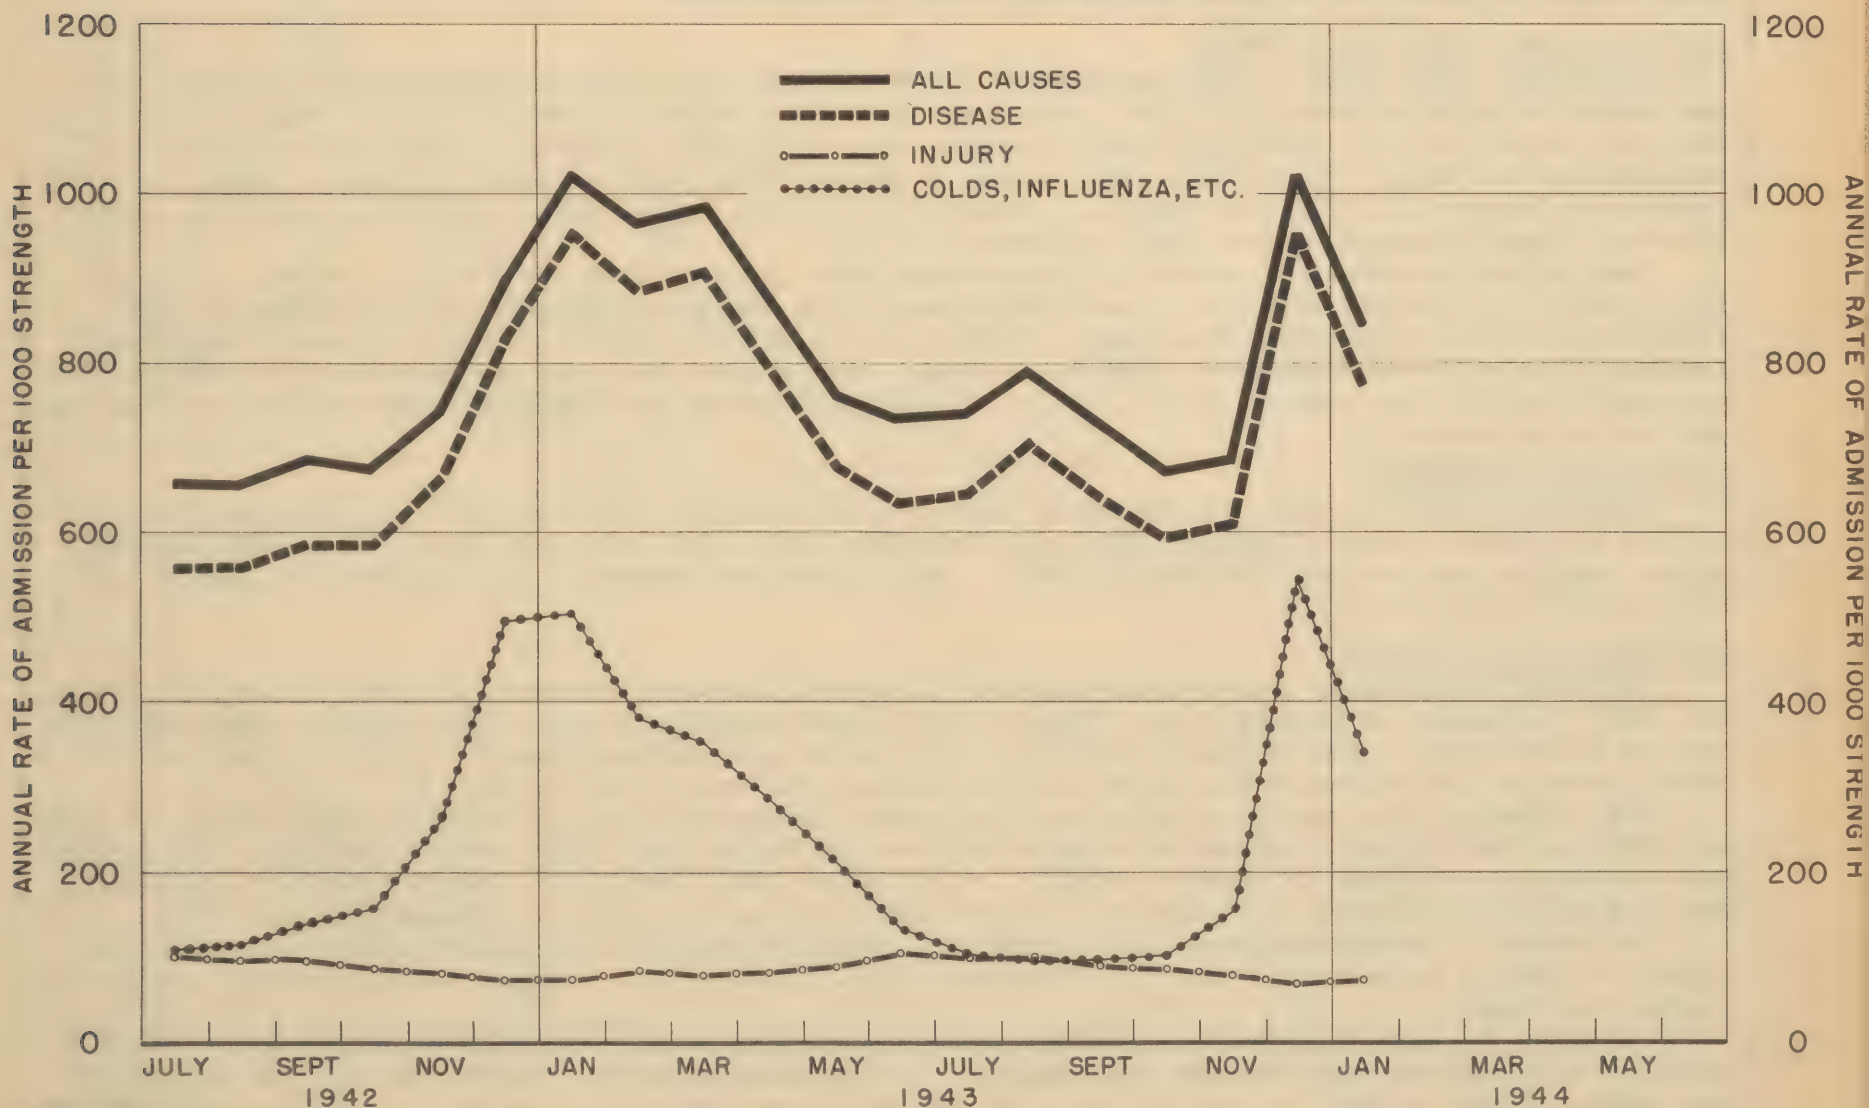

Morbidity from colds, influenza, etc. declined from the high rate of about 550 per year per 1000 for December 1943 to about 340 per 1000 during the four week period ending 20th January 1944. By the end of December the influenza outbreak had apparently run its course and admissions from colds, influenza, etc. were reported in January at an almost level rate each week. This rate was about 30 percent lower than the revised admission rate for January 1943, but somewhat higher than the corresponding rate for January 1942.

All Service Commands showed markedly lower morbidity from colds, influenza, etc. during the first four weeks of January, with the largest decreases being recorded in Commands which experienced the highest admission rates in December 1943. The Seventh Service Command continued to report the highest admission rate from colds, influenza, etc. (about 45 percent higher than the rate for the country as a whole), while the lowest rate was registered in the Ninth Service Command (almost 20 percent under the rate for the country as a whole).

Morbidity from all forms of pneumonia showed a seasonal rise of about 15 percent for the United States as a whole. The annual admission rate of 22.4 per 1000 reported for the first four weeks of January was nevertheless about 20 percent below the revised admission rate for January 1943. Atypical pneumonia accounted for over 40 percent of the total pneumonia admissions or a somewhat higher percentage than in December 1943.

MORBIDITY FROM — ALL CAUSES — DISEASE — INJURY — COLDS, INFLUENZA, ETC.

CONTINENTAL UNITED STATES

RESTRICTED

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

The Seventh Service Command reported by far, the highest morbidity from pneumonia, reflecting largely an outbreak at Jefferson Barracks, Mo. The lowest admission rate from pneumonia continued to be reported from the Ninth Service Command. As in earlier months the proportion of cases diagnosed as atypical pneumonia was high in the Military District of Washington and the Fifth Service Command, but the Third Service Command reported the highest proportion of atypical pneumonia.

MEASLES, MUMPS, AND SCARLET FEVER

Morbidity from measles, mumps and scarlet fever exhibited the expected seasonal sharp upward trend. The admission rate for measles tripled during the first four weeks of January 1944 as compared with December 1943, while the corresponding rates for mumps and scarlet fever doubled. Nevertheless, morbidity from measles and mumps for the first four weeks of January 1944 remained about 45 percent under that registered in January 1943 (revised basis). Scarlet fever on the other hand showed an incidence in January 1944 more than 50 percent higher than in January 1943.

The largest increases in morbidity from measles were reported from the Fourth, Seventh, Third and Eighth Service Commands, with the highest incidence in the Fourth and Seventh Service Commands. The largest increases in morbidity from mumps occurred in the Third and Seventh Service Commands and these Commands also reported the highest admission rates. The largest increases in morbidity from scarlet fever were registered in the Seventh, Sixth, and Fifth Service Commands and the same Commands also had the highest admission rates.

DIARRHEA AND DYSENTERY

Admissions from diarrhea and dysentery continued at about the same rate (9.0 per year per 1000) during the first four weeks of January 1944 as in December 1943. This rate was however about 80 percent higher than the revised rate for January 1943. The highest rate reported from any Service Command was 14.3 per 1000 from the Fifth.

NEUROPSYCHIATRIC DISORDERS

The rate of admission from neuropsychiatric disorders increased somewhat to about 27 per 1000 during the first four weeks of January 1944. This is still considerably below the high admission rates for July through October 1943, when special efforts were made to detect neuropsychiatric disorders, particularly in connection with the reconsidering of the medical fitness of limited service men.

The admission rate from neuropsychiatric disorders increased in all Service Commands except the First and Eighth. The largest increases were reported from the Second and Sixth Service Commands. The Second Service Command continued to show the highest rate (44 per 1000), while the lowest rates were reported from the Military District of Washington (16 per 1000) and the Ninth Service Command (19 per 1000).

The number of neuropsychiatric cases remaining under treatment on 28 January 1944 was reported at 15,974 or about 5 percent more than on 31 December 1943. Most of the increase was reported in other than locked ward cases.

Attention is called to the fact that neuropsychiatric admission rates were recently revised on the basis of a study made from December 1943 reports. An explanation of the reasons for and the nature of this revision was included in the Supplementary Health Report attached to the Weekly Health Report for the

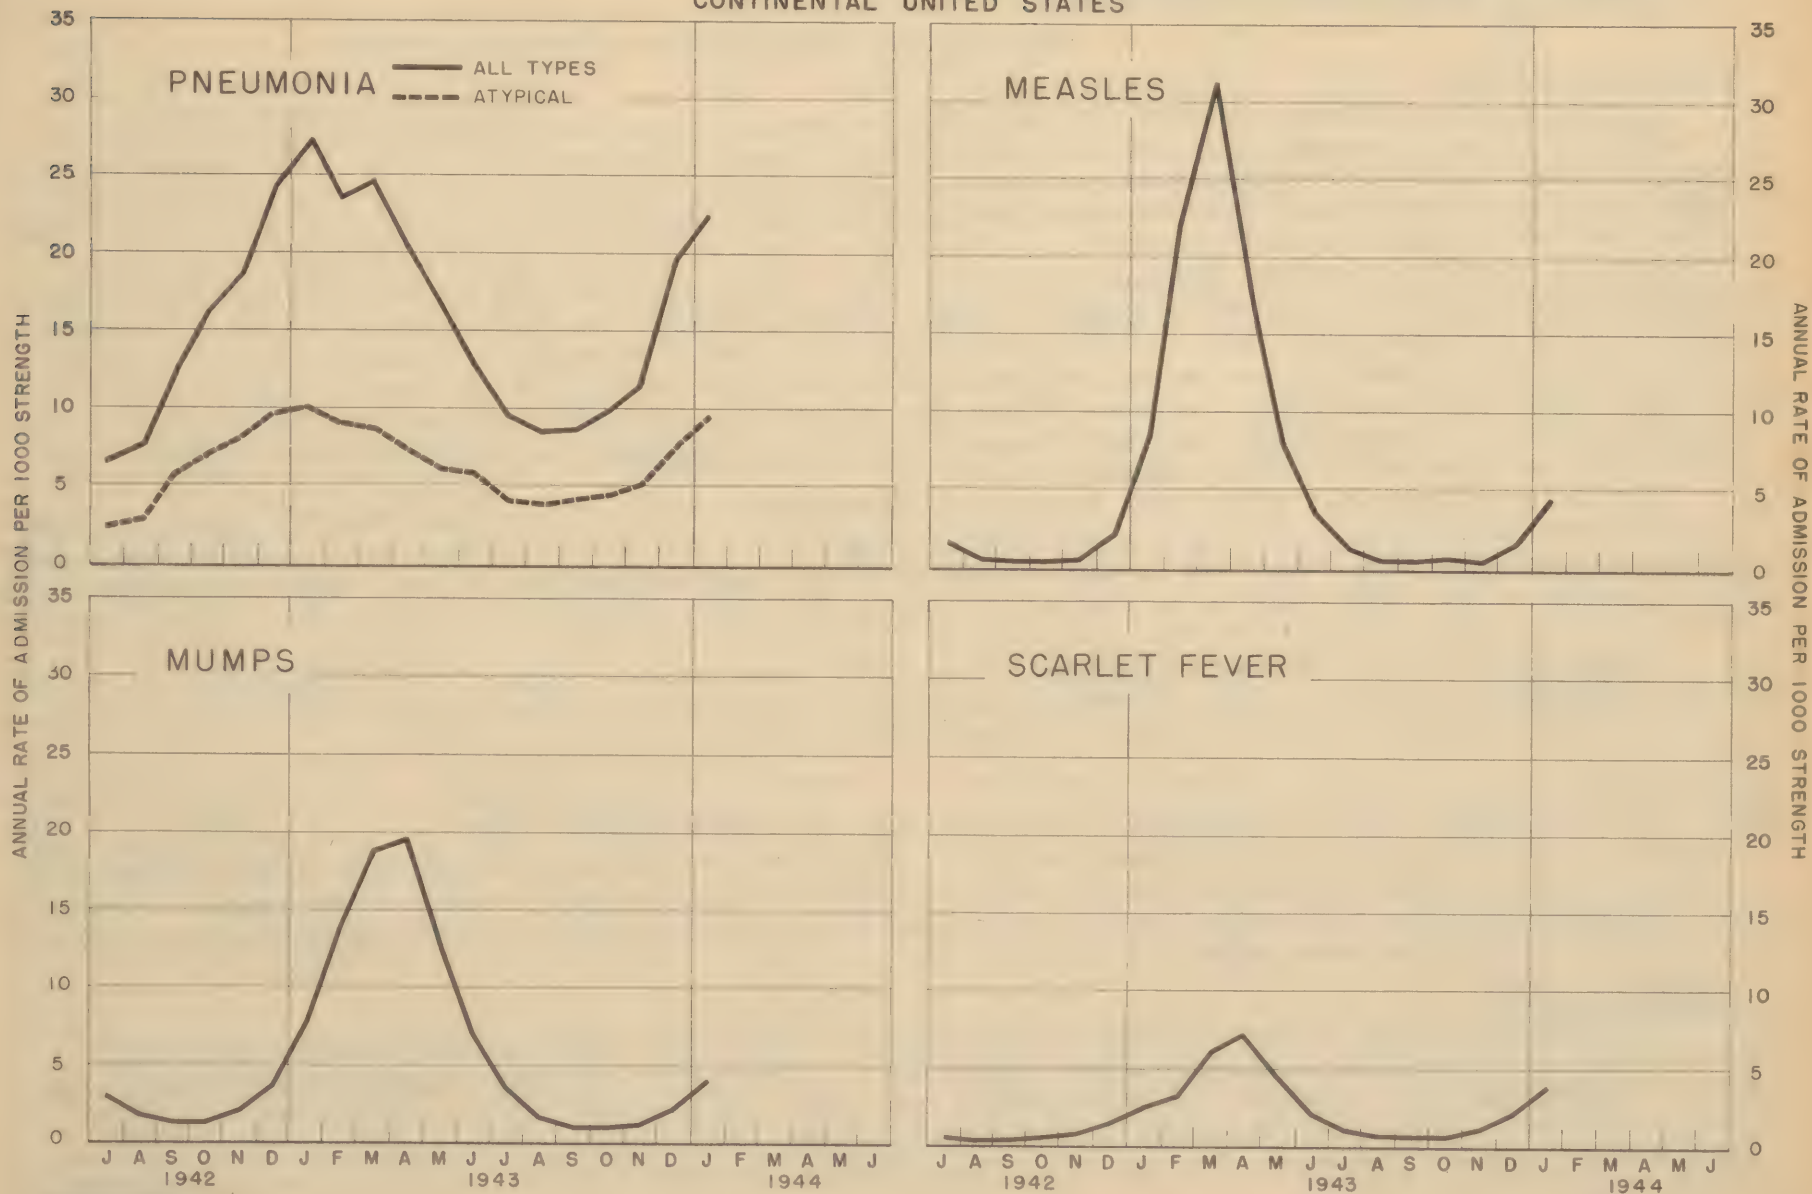

MORBIDITY FROM ———

PNEUMONIA — MEASLES

RESTRICTED

MUMPS — SCARLET FEVER

CONTINENTAL UNITED STATES

RESTRICTED

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

week ending 21 January 1944. It will be noted that the neuropsychiatric admission rate reported for the first four weeks of January 1944 is in line with the revised series of admission rates.

VENEREAL DISEASES

Morbidity from venereal diseases excluding EPTI cases increased from about 25 per year per 1000 in December 1943 to 30 per year per 1000 for the first four weeks of January 1944. This rate is with one exception (August 1943), the highest recorded since November 1942, when the reporting of EPTI admissions separately was first begun. The increased morbidity was preponderantly due to a higher rate of admissions from gonorrhea. Every Service Command except the Third and the Military District of Washington showed higher morbidity from venereal diseases excluding EPTI. By far, the largest increase in such morbidity was registered in the Fifth Service Command. This Command reported the highest admission rate from venereal diseases excluding EPTI (43.7 per year per 1000) during the four week period ending 28 January 1944, but was closely followed by the Second Service Command (42.7 per 1000). In the latter, a large proportion of cases were among task force troops not under the jurisdiction of the Second Service Command. As in previous months, morbidity from venereal diseases excluding EPTI, was lowest in the Military District of Washington and the First Service Command.

Morbidity represented by venereal EPTI cases was reported for the first four weeks of January 1944 at about 28 per 1000, equaling the record high for November 1943. Variations by Service Command in admission rates for venereal EPTI cases have little significance, because they reflect in part different geographical distribution of the Army relative to that of selectees, different proportions of white and colored inductees, and varying administrative practices.

Morbidity from all venereal diseases including EPTI cases exceeded 58 per 1000 per year for the first four weeks of January 1944. This is the highest rate of morbidity from these causes recorded in at least a decade and culminates a steady upward trend which began early in 1943.

MENINGITIS

The admission rate from meningitis increased over 50 percent and for the first four weeks of January 1944 was reported at about 1.0 per year per 1000. This is only about half of the rate reported from this cause in January 1943 and only a third of the peak rates for 1943 reached in March. The largest increase in the admission rate from meningitis was registered in the Fourth Service Command which also reported the highest morbidity from this cause.

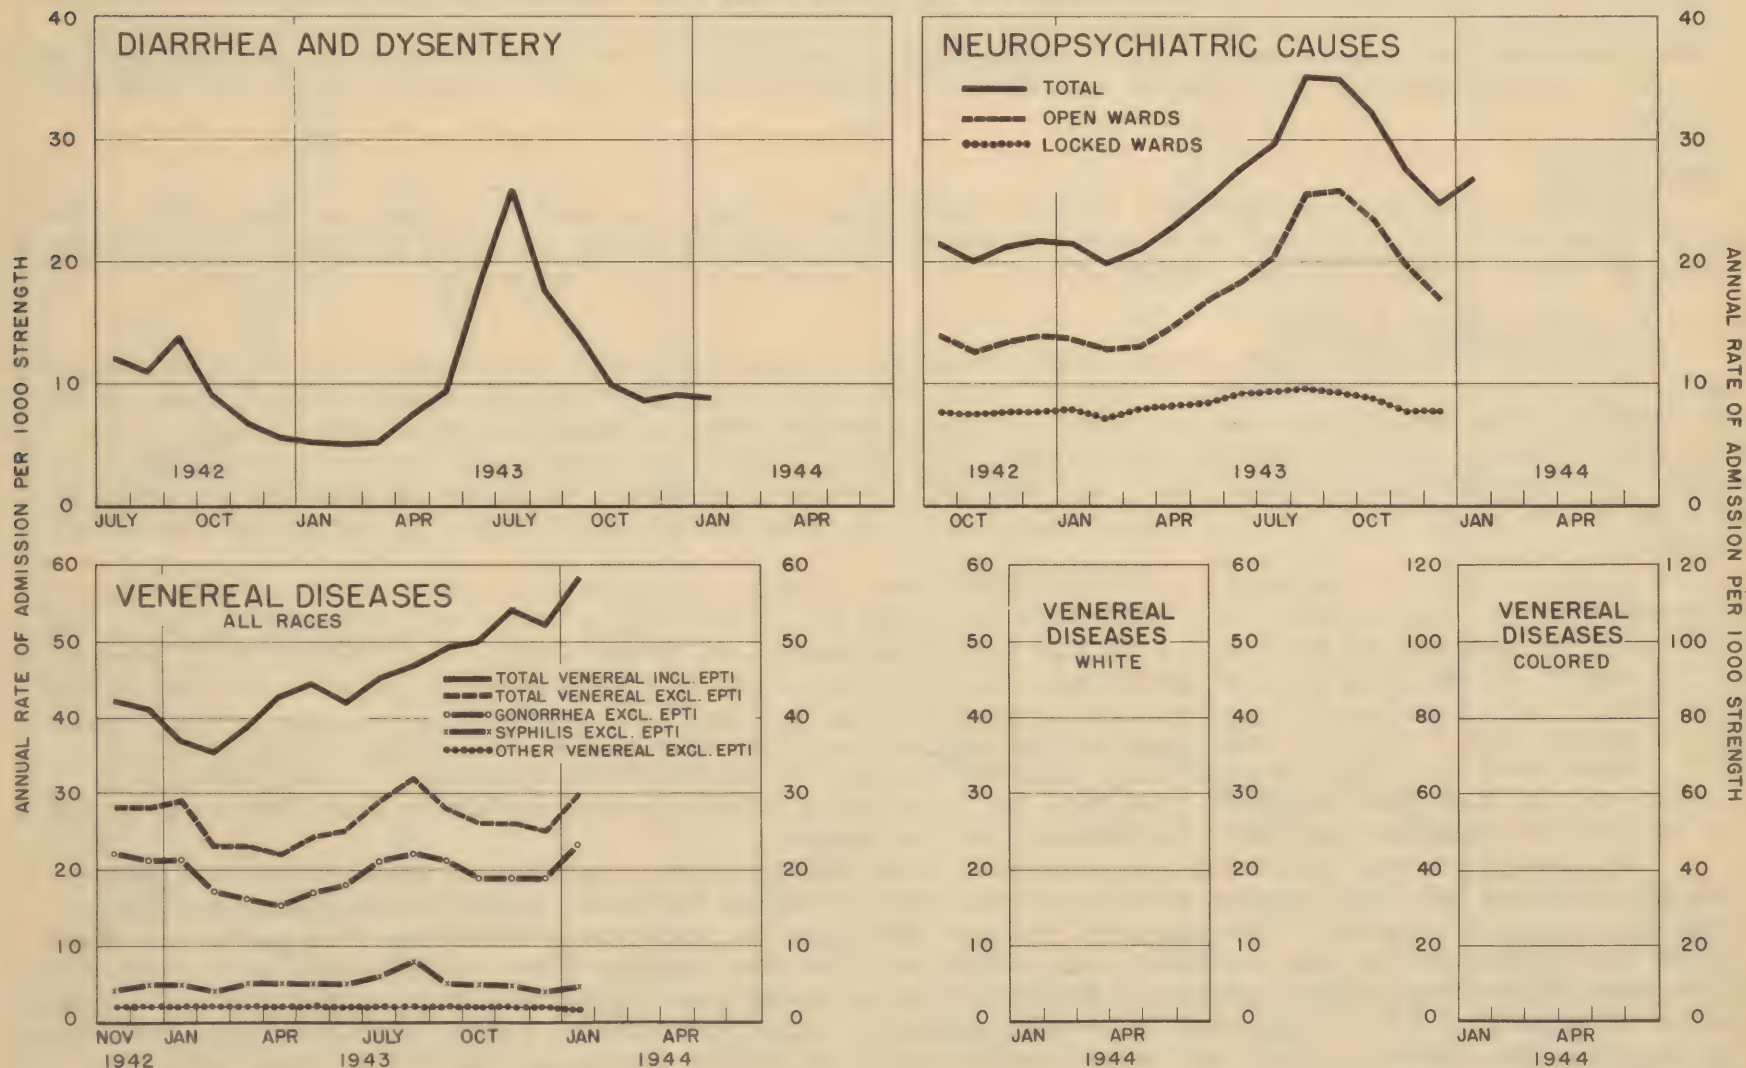

RHEUMATIC FEVER

The morbidity from rheumatic fever was reported at 1.4 per year per 1000 for the four week period ending 28 January 1944 or about 75 percent higher than in December 1943. This admission rate was several times higher than that recorded for January 1943 but lower than the peak rates for 1943 reached in April, May, and June. The largest increases in the admission rate from rheumatic fever occurred in the Sixth, and Seventh Service Commands. The latter continued however to report by far the highest morbidity from this cause (6.1 per 1000).

MORBIDITY FROM

- DIARRHEA AND DYSENTERY
- NEUROPSYCHIATRIC CAUSES
- VENEREAL DISEASES

CONTINENTAL UNITED STATES

RESTRICTED

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

MALARIA

Morbidity from malaria acquired in the United States continued at the very low rate of .1 per year per 1000. On the other hand, malaria presumably acquired outside of the United States showed an admission rate of 3.1 per 1000 the highest yet recorded. The progressive increase in the admission rate for malaria acquired overseas reflects the increasing number of troops returning to the United States from malarious areas. Whereas the largest numbers of cases of malaria acquired in the United States are usually reported from the Southern states, the cases of malaria acquired overseas are more uniformly distributed geographically.

TUBERCULOSIS

Morbidity from this cause showed little change from the very low rate of .9 per year per 1000 recorded in December 1943. This was the lowest admission rate reported during the past two years. The variations by Service Command in the admission rate from tuberculosis do not appear to be significant.

STATIONS WITH HIGHEST MORBIDITY

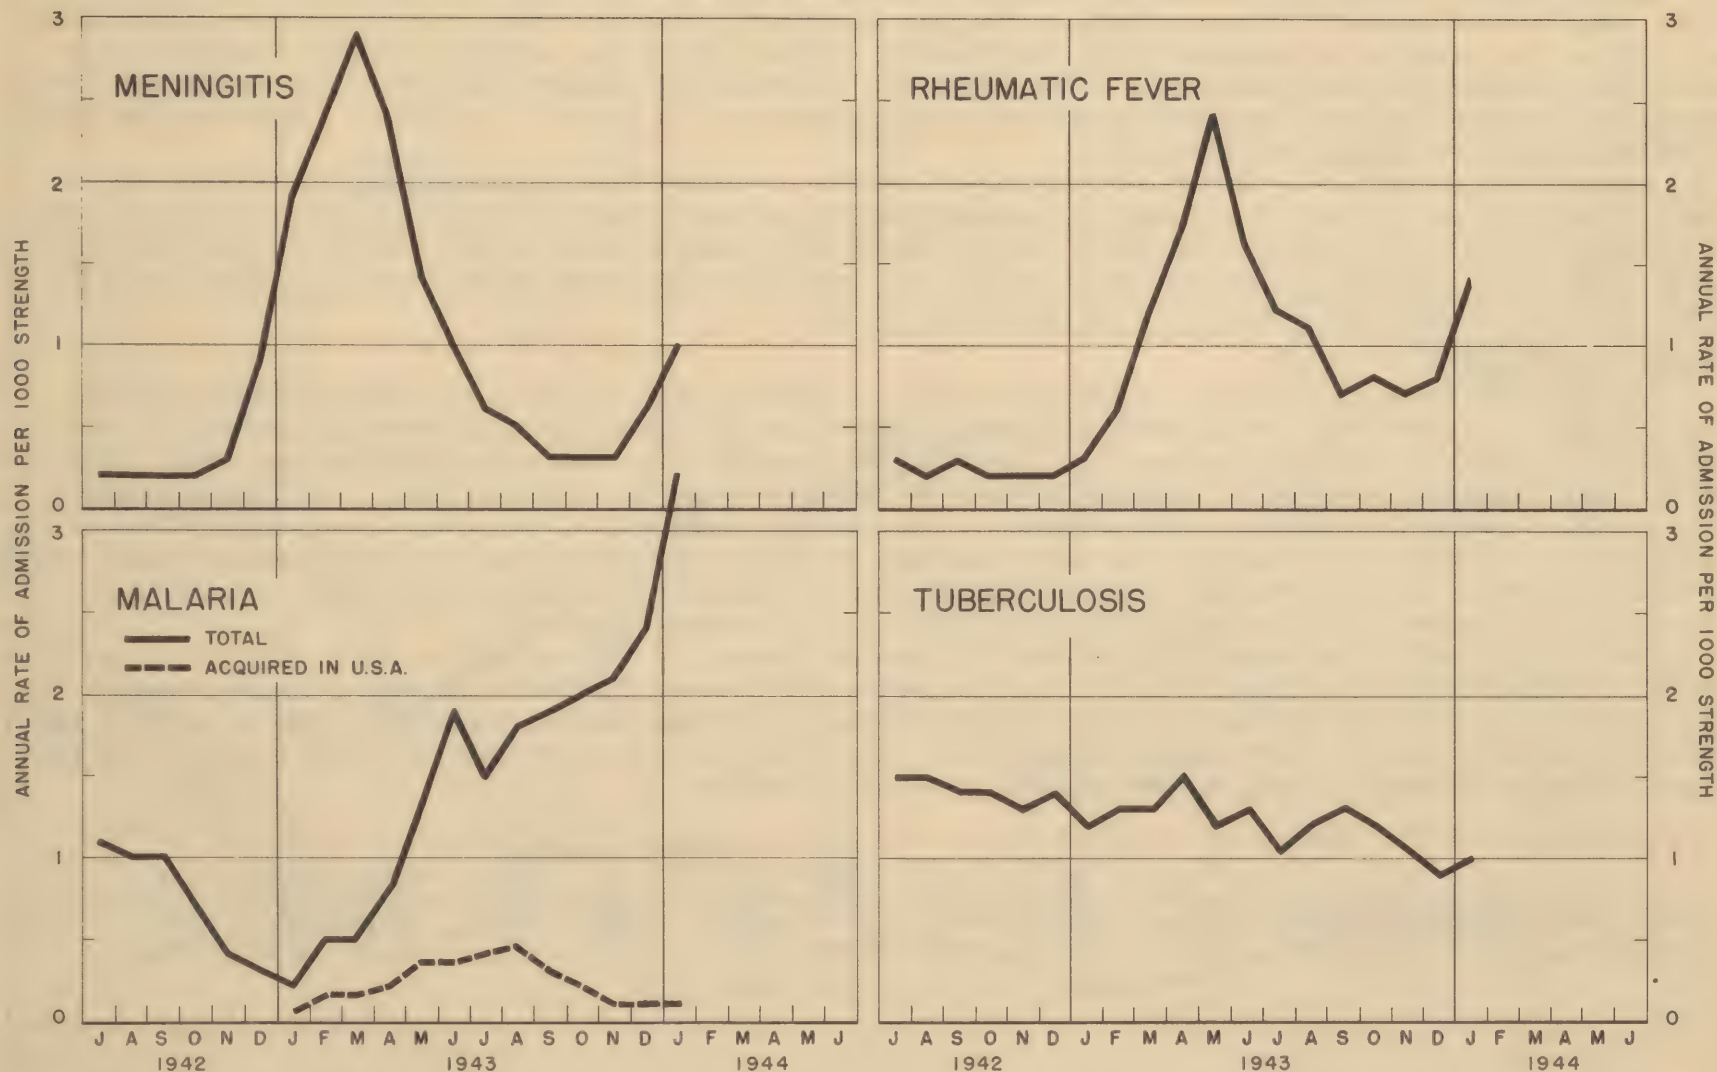

As in previous months there was a large proportion of small stations with strength under 5000 among the stations reporting the highest admission rates for the first four weeks of January 1944. Three of the six stations with the highest admission rates were reception centers (Presidio of Monterey, Calif; Fort Benjamin Harrison, Indiana; and New Cumberland, Pa.) all of which had high morbidity due to venereal EPTI cases. Washington State College, Wash. and New York General Dispensary which may be regarded as typical of some of the small stations with high admission rates, experienced relatively high morbidity from colds, influenza, etc.

Very high rates of admission for colds, influenza, etc. in Fort Wadsworth, N.Y. and from all forms of pneumonia at Coral Gables, Fla.; Jefferson Barracks, Mo.; Sioux Falls, S.D.; and Fort Tilden, N.Y. were registered in December as well as during the first four weeks of January 1944. Camp Shanks, N.Y. continued to report a very high rate of admissions from venereal disease, preponderantly gonorrhea. Camp Savage, Minn. which had an extremely high rate of admissions from diarrhea and dysentery in December 1943, continued to report high morbidity from these causes during the first four weeks of December 1943. West Point, N.Y. Cadets also continued to experience high morbidity from diarrhea and dysentery. West Point, N.Y. Cadets and the Louisiana Maneuver Area were the only units which reported morbidity from injury in excess of 200 per thousand per year both in December and in January.

Camp Fannin, Texas; Jefferson Barracks, Mo.; Camp Shelby, Miss.; and Bryan, Texas which were among the six stations with the highest morbidity from measles during December, again reported high morbidity from this cause in January. Freeman AAF, Indiana continued to report high morbidity from mumps for the third consecutive month. An extremely high admission rate from scarlet fever was reported in January from Cincinnati University, Ohio; Cincinnati University also experienced relatively high morbidity from scarlet fever in December 1943. Pittsburgh University ASTU, Pa. also continued to report high morbidity from scarlet fever. Camp Wolters, Texas and Jefferson Barracks, Mo. which were among the six stations with the highest morbidity from meningitis in December 1943 reported even higher admission rates from this cause in January. Buckley Field, Colo.; Kearns, Utah; and Camp Hale, Colo. continued to report high morbidity from rheumatic fever.

MORBIDITY FROM — MENINGITIS — RHEUMATIC FEVER — MALARIA — TUBERCULOSIS

CONTINENTAL UNITED STATES

RESTRICTED

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

MORTALITY

The mortality rate from all causes was reported at 2.62 per year per 1000 for the first four weeks of 1944. This is the highest rate reported in the past two years. Diseases were responsible for .56 deaths per 1000 or the same as in December 1943, but about 25 percent below the revised rate for January 1943. Injuries accounted for 2.06 deaths per 1000, which was likewise the highest rate reported during the last two years. This high death rate from injuries is attributable to a number of airplane accidents involving numerous fatalities among Army personnel.

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 25 percent and occasionally even more, but the death rate from disease is not materially understated. Readers are cautioned not to use the death rates from injury or the death rates from all causes shown in these reports as accurate indications of mortality rates.

NON-EFFECTIVE RATE

The non-effective rate for the first four weeks of January 1944 was 39.6 per thousand strength or about 5 percent lower than for December 1943 which showed an exceptionally high rate as a result of the influenza outbreak. For the four week period ending 25 January 1944, the non-effective rate from injury was 7.7 per thousand strength or exactly the same as that reported for December 1943. It is noteworthy that injuries accounted for almost 20 percent of the total non-effective rate even though injury admissions represented only about 8 percent of the total admissions during the first four weeks of January 1944. Part of this difference arises from the relatively high rate of admissions during January from respiratory causes which in most instances had a very short duration of hospitalization.

The variations in the non-effective rate by Service Command do not reflect so much the variations in morbidity between Service Commands as the varying number of General Hospitals in each Service Command. When comparisons are made between the non-effective rates excluding General Hospitals, the variations in the non-effective rate by Service Command are seen to be very much smaller than when the days lost in the General Hospitals are included, as evidenced in the table below:

	Service Command									
	I	II	III	MDW	IV	V	VI	VII	VIII	IX
Including General Hospitals	30.4	46.2	41.3	64.1	36.9	49.9	39.3	43.8	37.7	38.4
Excluding General Hospitals	25.2	25.3	30.4	23.7	27.3	27.2	28.7	32.2	27.0	28.5
